# Edit a web page

1 Go into the `my-first-website` folder and open the `about-me.html` file.

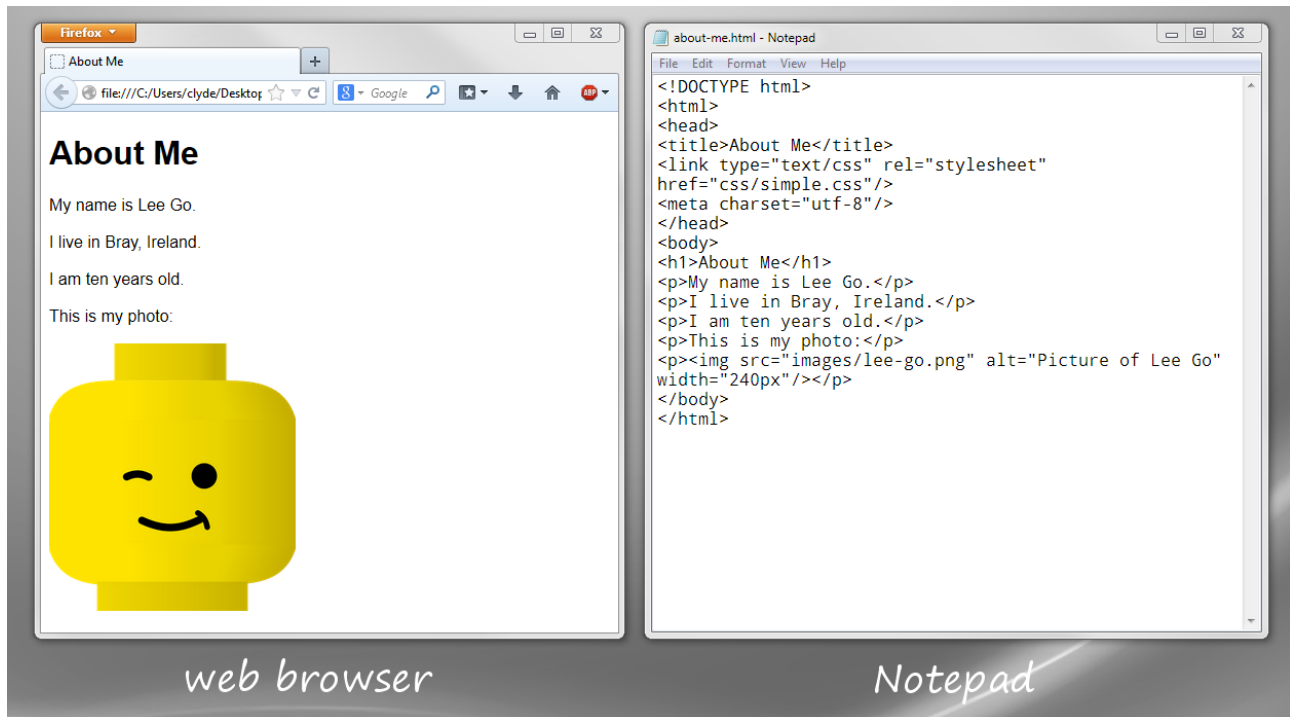

open this file

It opens in your web browser.

2 Now open the same file in a plain text editor such as Notepad.

web browser

Notepad

```
<!DOCTYPE html>
<html>
<head>
<title>About Me</title>
<link type="text/css" rel="stylesheet"
href="css/simple.css"/>
<meta charset="utf-8"/>
</head>
<body>
<h1>About Me</h1>
<p>My name is Lee Go.</p>
<p>I live in Bray, Ireland.</p>
<p>I am ten years old.</p>
<p>This is my photo:</p>
<p><img src="images/lee-go.png" alt="Picture of Lee Go"
width="240px"/></p>
</body>
</html>
```
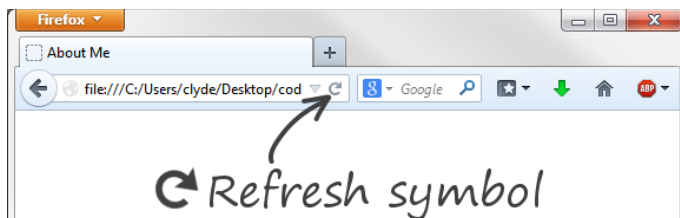

3 Arrange the Browser window and the text editor window so that they are alongside one another on your screen.

web browser   Notepad

4 Change the text in the page so that it's about you – not Lee Go.

5 After you have changed some text, save the file in Notepad and then refresh the web page in your browser window. To do this click the Refresh symbol.

* What happens?

6 Now put in a new paragraph of text. This needs to go between the `<p>` and `</p>` tags.

Like this:

`<p>I am learning how to make a website at CoderDojo.</p>`

`<p>` is the start tag for a paragraph element, `</p>` is the end tag.

7 Again, Save and Refresh.

You can see now that a web page is just text typed into a text file. How the text appears on the web page is controlled by the tags.

* What happens if you use `h1` or `h2` elements instead of `p`?

* What happens if you put some words inside `strong`? Like this:

`<p>My name is <strong>Lee Go</strong></p>`
